PHASE 05 / GEMINI AND RECOMMENDATION LOGIC

Gemini and recommendation logic

AI suggestions should be structured, useful, and constrained by the user's total budget.

Activities

Keep the Gemini model configurable; send text instructions and the optional outfit image from the server only.

Ask for JSON with short summaries and recommendation cards containing category, title, description, estimate, platform, and search query.

Treat the submitted budget as a hard ceiling; normalize returned suggestions and scale estimates if the model exceeds it.

Use planner-specific context: room and style for home, guest count and location for parties, occasion and outfit cues for jewelry.

Handle timeouts, provider errors, malformed JSON, or empty results by returning local recommendations with a visible source label.

Phase outputs

Acceptance checks

A configured Gemini response is parsed into the same schema as local suggestions.

The displayed estimate total does not exceed the submitted budget.

Failures still return usable plans and never expose API keys or raw provider errors.
